Sika® Grout 212 / 212 SR
Non-Shrink, Cementitious Grout

Description
Sika® Grout 212 is a non-shrink, cementitious grout with a unique two-stage shrinkage compensating mechanism, compensating for shrinkage in both the plastic and the hardened states. It is non-metallic, contains no chlorides and may be placed at various consistencies ranging from dry pack to fluid by simply adjusting the quantity of mixing water. Sika® Grout 212 SR is a sulphate resistant fluid grout.

Where to Use
- On grade, above and below grade, interior and exterior applications.
- Structural grouting of column base plates, machine base plates, anchor bolts, bearing plates, bridge seats, precast wall panels.

Advantages
Sika® Grout 212
- Pre-blended for easy application and maximum field control. Just add water, mix and place.
- Versatile, can be applied in any consistency from dry pack to fluid.
- Non-corrosive does not contain chlorides.
- Excellent pumpability - does not segregate even at high flow; no build-up on equipment hopper.
- Low heat development.
- Superior freeze/thaw resistance.
- Ministry of Transport Ontario approval for use in grouting bridge bearings as well as anchor bars. (Reports MI-110, MI-120 respectively).
- Meets Ontario Hydro specification M-690-87 for pumping through grout pump and hoses for a distance of up to 60 m (196 ft).
- Ministry of Transport Québec acceptance for grouting anchor bolts and reinforcing dowels in concrete.
- Meets H. A. Simons grout specification 1S-05.01 for grout types 1, 2a, 2b, 2c, 3 and 4.
- Meets ASTM C1107 for Grade C type grouts.

Sika® Grout 212 SR
- Meets CSA A23.1-A23.2 guidelines for severe sulphate exposure.

Technical Data

Packaging 25 kg (55 lb) bag
Colour Concrete Grey
Yield Approx. 13 L (0.46 ft³) per bag of fluid grout
Shelf Life 1 year in original, unopened packaging. Store dry at 5° - 32°C (41° - 89°F). Condition product to 18° - 29°C (65° - 84°F) before using.
Mixing Ratio
- Sika® Grout 212 4.6 L (1.21 US gal.) water/bag max.
- Sika® Grout 212 SR 4.3 L (1.14 US gal.) water/bag max.

Properties at 23°C (73°F) and 50% R.H.

Sika® Grout 212 (tested at water/solids ratio of 0.18 by weight)
- Aggregate grading ASTM C136 100% passing 2.5 mm (3/32 in)
- Flow cone CAN A23.2-1B 25-35 sec
- Set time ASTM C403 Initial 5 h
- Sika® Grout 212 SR (tested at w/c ratio of 0.40)
- Aggregate grading ASTM C136 100% passing 2.5 mm (3/32 in)
- Flow cone CAN A23.2-1B 30-50 sec
- Set time ASTM C403 Initial 4.5 h

* Fluid consistency compressive strengths are given as minimum guidelines. Pourable and dry pack consistencies will easily exceed these values.
** Meets guidelines of severe sulphate exposure.

Sika® Grout 212
Freeze/Thaw Durability ASTM C666, Procedure A
- Relative dynamic modulus 101.9%
- Durability factor 101
- No significant change to specimen

(Data based on results obtained from pull tests on 15 M, epoxy coated rebars grouted into 30 MPa (4350 psi), 80 ± 10 mm slump, 6 ± 1% air entrained concrete block)

How to Use

Surface Preparation

All grease, oil laitance, ice or snow and foreign deposits shall be removed from all surfaces with which the grout will come in contact.

The concrete foundation shall be roughened to the extent that it does not present a smooth surface, which would impede the bond of the grout to the foundation. All dust and loose particles shall be removed by sandblasting, high pressure waterblasting or other suitable means.

Concrete foundations less than 28 days old shall be kept wet for at least 12 h, and older foundations for a minimum of 24 h before placing grout. All free-standing water shall be removed from concrete surfaces prior to grouting. All items to be grouted into place shall be properly positioned and anchored prior to grouting except for anchor bolts and dowels, which may be placed into the fresh grout if job conditions permit and at the discretion of the engineer in charge. For grouting of base plates the formwork used to contain the grout shall be constructed in a workmanlike manner and caulked to prevent leakage of grout. Provisions shall be made at the high points for air to be vented as it is displaced by grout.

Mixing

Mix using a heavy duty low-speed drill (300-450 rpm) and mixing paddle or in a grout mixer. The size of the mixer should be appropriate to the volume of grout required. Use a minimum amount of water consistent with placeability requirements. After all dry product has been added to the water, continue mixing for 3 min.

Application

The prepared grout may be pumped or transported to the forms in buckets or wheelbarrows and deposited without delay. External vibration and agitation of the grout in the forms is permitted. Grout having been prepared but not placed within 1 h after preparation shall be discarded. Prepared grout shall be agitated until use. Several hours after placement of grout (depending on ambient temperatures) forms may be removed and exposed grout shoulders may be trimmed or shaped to desired finish.

Curing

As per ACI 308 recommendations for cement concrete, curing is required. To achieve performance consistent with the results furnished on the technical data sheet, curing must be provided by recognized curing methods, such as, mist spray of water/damp burlap, white polyethylene film or approved curing compound. Moist curing must commence immediately after finishing. Protect freshly applied grout from direct sunlight, wind rain and frost.

Clean Up

Do not leave material to harden before cleaning tools and equipment with water. Hardened material can only be removed mechanically.

Limitations

- Maintain wet grout, ambient and substrate temperatures between 5° - 32°C (41° - 89°F) for a period of 72 h after placing.
- Sika® Grout 212 and 212 SR must be protected from freezing during setting.
- For anchor bolt/dowel grouting, hole diameter should be 25 mm (1 in) greater than bar diameter.
- Anchor bolt/bar holes should be pre-dampened for a period of 1 h prior to grouting. Holes must be in saturated surface dry (SSD) condition at time of grouting.
- Do not use as a patching or overlay mortar or in unconfined areas.

Caution

Contains cement and silica sand which may in certain cases, cause skin and eye irritation. Avoid breathing dust. Use only with adequate ventilation. In confined areas, use of a NIOSH/MSHA approved respirator is recommended. Consult product label for additional information.

First Aid

In case of skin contact, wash with soap and water. For eye contact flush immediately with plenty of water for at least 15 min. Contact a physician. For respiratory problems, transport victim to fresh air. Remove contaminated clothing and wash before re-use.
